Task 03: Prompting for Task Automation

Prepared by: Shaik Suheal

Introduction

Task Automation uses prompt engineering to automate repetitive activities such as summarizing text, extracting information, and converting content into structured formats. The goal is to create prompts that consistently generate reliable outputs for different inputs.

Automation Prompt

You are an AI assistant that summarizes content. Read the input text and provide: 1) A short summary, 2) Five key points, and 3) Action items if available.

Input-Output Example 1

Input: Students should complete assignments before deadlines, attend classes regularly, and participate in workshops to improve their skills.

Output:

Summary: Students should focus on academics and skill development.

Key Points: Complete assignments, meet deadlines, attend classes, participate in workshops, improve skills.

Action Item: Maintain a learning schedule.

Input-Output Example 2

Input: The company launched a new AI product that improves customer support through automation and analytics.

Output:

Summary: The company introduced an AI-powered customer support solution.

Key Points: New product, AI technology, automation, analytics, customer support improvement.

Action Item: Evaluate implementation opportunities.

Input-Output Example 3

Input: Python is widely used for web development, data science, machine learning, automation, and software development.

Output:

Summary: Python is a versatile programming language used across multiple domains.

Key Points: Web development, data science, machine learning, automation, software development.

Action Item: Learn Python fundamentals and libraries.

Prompt Iteration and Debugging

Initial Prompt: Summarize the given text.

Issue: Responses lacked structure and consistency.

Improved Prompt: Summarize the text and provide five key points and action items.

Result: More structured and reliable outputs across multiple inputs.

Reflection

This task demonstrated how carefully designed prompts can automate common tasks efficiently. Adding clear instructions improved consistency and output quality.

Conclusion

Prompt-based automation can save time and improve productivity by converting unstructured information into organized summaries and actionable insights.
